Amendments to the Specification:

Please replace the paragraph 39 beginning on page 2 and continuing onto page 3 with the following paragraph:

FIGS. 2 and 3 illustrate the provision of, respectively, two and three inner layers "A"/"B" pairs of coatings. The repetition of "A"/"B" layers is what finally gives a multip-layer structure. The greater the number of "A"/"B" pairs, the better the reliability of a window. That is, the probability of the occurrence of pinholes is lower, but the manufacturing cost is higher. The total surface density of the coating preferably does not exceed about 0.3 mg/cm^2. Practically, the number of "A"/"B" pairs is usually one to five.
